1. Within the next 25 years, AIDS is set to join heart diseases and stroke as the top three causes of death worldwide. Currently ranked fourth behind heart diseases, stroke and respiratory infections, AIDS is set to become No.3.It accounts for about 2.8 million deaths every year. But researchers estimate a total of nearly 120 million people whodie in the next 25 years, overall, researchers estimate predict that in the next three decades, the causes of global mortality will be strikingly similar worldwide apart from the prevalence of AIDS in poorer countries. Most people will be dying at older age of non- infectious diseases like cardiovascular diseases, stroke and cancer.

2. The World Health Organization estimate that a total of at least 117 million people will die from AIDS from 2006 to 2030. In an optimistic future projection, if new HIV infections are curbed and access to life-prolonging anti-retroviral is increased, 89 million people will die from the disease. "What happen in the future depends very much on what the international community does now." said Mothers, who is a doctor, These marked differences should spark changes in current approaches to controlling AIDS now say some experts.

3. "It will be increasingly hard to sustain treatment programs unless we can turn off the tap of new HIV infections," said Richard Hays "These AIDS numbers point to a need to do more in prevention" Simply focusing on treatment or politically uncontroversial prevention methods will not suffice. "You can't put all your eggs in the abstinence basket, "said Hays. "We need a menu of strategies for real people, "he said, adding that condom distribution as well as new methods, such as a vaccine, are needed.

4. Mathers and Loncar analyzed data from more than 100 countries. The authors looked at the like between mortality trends and income per capita, as well as factors including education levels and tobacco use. Their research also used UN estimates for projected AIDS infection rates and the World Bank's number for future income per capita. They predicated the future causes of deaths and diseases.

5. This is an important contribution that will help us determine the priorities in public health, "said Majid Ezzati, a doctor and an associate professor of international health at Harvard university, who was not connected to the paper. While it may be possible to avert some of the impending damage from HIV/AIDS, Mathers says that other predictions are unlikely to vary significantly. As populations age, he explains they are naturally more susceptible to illnesses like cancer and heart diseases than infectious diseases-even in the developing world, Life expectancy is expected to increase worldwide, with the highest projected life expectancy in 2030 to be Japanese women at
